# Q1200专用校准固件编译

Q1200校准固件使用MTK原始SDK编译的固件。

相关版本如下图:

```
34.728000] CountryCode(2.4G/5G)=5/7, RFIC=25, PHY mode(2.4G/5G)=
    35.876000] br-lan: port 1(eth0) entered forwarding state
    35.944000] br-lan: port 2(ra0) entered forwarding state
    36.572000] br-lan: port 3(rax0) entered forwarding state
BusyBox v1.22.1 (2023-12-26 16:39:21 CST) built-in shell (ash)
Enter 'help' for a list of built-in commands.
 BARRIER BREAKER (Barrier Breaker, unknown)
  * 1/2 oz Galliano
                          Pour all ingredients into
  * 4 oz cold Coffee
                          an irish coffee mug filled
  * 1 1/2 oz Dark Rum
                          with crushed ice. Stir.
    2 tsp. Creme de Cacao
 MTK OpenWrt SDK V3.4
 revision : 1443366e
 benchmark: APSoC SDK 5.0.1.0
 kernel : 169495
root@OpenWrt:/#
root@OpenWrt:/#
root@OpenWrt:/#
```

## 编译前准备资料

SDK文件: mtk-openwrt-sdk-20170518-1443366e.tar.xz

SDK使用手册: MTK-OpenWrt-3.10.14-SDK-Release-Notes.docx

# 编译注意事项

解压SDK后,建立好依赖库软连接,使用 make menuconfig 选择好目标平台。

```
Target System (MTK/Ralink APSoC (MIPS)) --->
Subtarget (MT7621 based boards) --->
Target Profile (Default Profile) --->
Target Images --->
Global build settings --->
[] Advanced configuration options (for developers) --->
[] Build the OpenWrt Image Builder
```

### 改动点

#### 1、mtd分区修改

改动文件: linux-3.10.14/drivers/mtd/ralink/ralink bbu spi.c

主要是修改添加 firmware 几个分区。修改大小和偏移位置。

修改内容参考此patch:

```
▼ 132-ikuai-mtd-modify.patch
 1 --- linux-3.10.14.orig/drivers/mtd/ralink/ralink_bbu_spi.c 2024-01-02 15:11:18
 2 +++ linux-3.10.14/drivers/mtd/ralink/ralink bbu spi.c
                                                               2024-01-02 15:06:34.564

19 +
            }
20 +
21 +
22 };
23 #else /* CONFIG SUPPORT OPENWRT */
```

```
24 static struct mtd_partition rt2880_partitions[] = {
```

#### 2、开机流程中加入爱快固件检测脚本

开机的时候,需要检测添加的mtd分区内是否有ikuai的固件,如有,需要将其读取出来放在 tmp 目录下,以供升级脚本使用。

进入根目录文件定义目录: target/linux/ramips/base-files

在 etc 目录下创建 init.d 目录,新建一个 ikrc 启动脚本。内容如下:

```
▼ ikrc
1 #!/bin/sh
2
3 echo S99run > /tmp/S99.log
4
5 dump firmware2()
6 {
7 (
      8
      if [ ! "$firm2_mtd" ];then
9
          echo "Not found part 'firmware2' in /proc/mtd" >> /tmp/mmlog
10
          return 1
11
      fi
12
13
      dd if=/dev/$firm2 mtd of=/tmp/firm2 info bs=1k count=1 >/dev/null 2>&1
14
      cat /tmp/firm2_info |while read a; do echo $a >> /tmp/firm2_info.tmp ;done
15
      if [ ! -f /tmp/firm2 info.tmp ];then
16
          echo "Not found iKuai params in /tmp/firm2_info" >> /tmp/mmlog
17
          return 1
18
      fi
19
      mv /tmp/firm2_info.tmp /tmp/firm2_info
20
      if ! . /tmp/firm2 info ;then
21
          echo "Not found iKuai params in /tmp/firm2_info" >> /tmp/mmlog
22
          return 1
23
      fi
24
25
      if [ "length" = "" -o "length" = "" -o "length" | " | 0 ]; then
26
          echo "invalid param: length md5" >> /tmp/mmlog
27
          return 1
28
      fi
29
30
      local dd count=$((length / 1024))
31
      echo "dumping firmware2 to /tmp/ikfirm2.bin" >> /tmp/mmlog
32
      dd if=/dev/$firm2 mtd of=/tmp/ikfirm2.bin bs=1k skip=1 count=$dd count >/de
33
34
      local firm2 md5=$(md5sum /tmp/ikfirm2.bin)
35
```

```
if [ "${firm2 md5:0:32}" != "$md5" ];then
36
           echo "check firmwar2 md5sum failure: $md5 != ${firm2 md5:0:32}" >> /tmp
37
           rm -f /tmp/ikfirm2.bin
38
           return 1
39
       fi
40
41
       echo "dumping firmware2 successfully" >> /tmp/mmlog
42
       return 0
43
44 )
45 }
46 dump firmware2
```

在 etc 目录下创建 rc.d 目录,并且新建一个软连接指向 ikrc

```
native/target/linux/ramips/base-files/etc/rc.d

31 ./
31 ../
31 S99ikuaiboot -> ../init.d/ikrc*
```

### 3、重写sysupgrade脚本内容

工厂校准完成后,需要执行 sysupgrade 命令来将校准固件切换到爱快固件。

需要重写该命令的执行内容,将 firmware2 分区内容写入。

文件内容请参考: <a href="http://gitlab.ikuai8.com/ap-group/ik\_new\_ap/blob/1.7.5\_release-sw5-w13-wireless-adjust/ik\_codes/ikwork/rootfs/sbin/sysupgrade">http://gitlab.ikuai8.com/ap-group/ik\_new\_ap/blob/1.7.5\_release-sw5-w13-wireless-adjust/ik\_codes/ikwork/rootfs/sbin/sysupgrade</a>

创建此文件,用以覆盖原来的 sysupgrade 脚本。

```
$
zqpeng@ikuai8:~/work/native/openwrt-sdk/target/linux/ramips/base-files/sbin
$ ls
sysupgrade
zqpeng@ikuai8:~/work/native/openwrt-sdk/target/linux/ramips/base-files/sbin
```

#### 4、交换无线接口

SDK默认 rao 是5G,而 raxo 是2G。而校准时的命令是反的。故需要进行交换。

修改内容参考此 patch:

```
